The invention describes a method of diagnosing breast cancer in subject comprising contacting biological sample from subject with at least two different breast cancer-associated polypeptides (I) encoded by nucleic acid molecules (II) comprising sequence chosen from 42 fully defined sequences as given in specification, determining specific binding between (I) and agents in sample, where presence of the binding is diagnosic for breast cancer. The method is useful for diagnosing breast cancer in a subject. The sample is blood, lymph node fluid or breast discharge fluid. This is the amino acid sequence of a breast cancer antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 71 LFSFESGRKCQTGQGIFAFKCARAEELFNMLQEIMQNNSINVVEEPVVERNNHQTELEVP 130

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                      The sequence represents the amino acid sequence of human suc-1-associated neurotrophic factor target protein (SNT-1). The invention provides fragments of SNT and fibroblast growth factor receptor (FGFR) which can form a binding complex that is amenable to structural determinations by muclear magnetic resonance (NNR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The invention fulfills the need for the determination of the three-dimensional structure of such complexes as described and for procedures for related structural base drug design predicated on such structural data
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LPSPESGRRCQTGQGIFAFKCARAEELFNMLQEIMQNNSINVVEEPVVERNNHQTELEVP 120

Sequences ABB10981-ABB12310 represent 1350 novel human polypeptides, and sequences ABA0925-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of detecting the nucleotides.

Co antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the nucleotides of polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable bological activities, and hence of giving an insight into their probable bological activities, and hence of giving an insight into their probable bological activities, and hence of giving an insight into their probable bological activities, or continging the invention may have activities, including cytokine, cell proliferation or cell and ematopoiesis regulatory activity; tissue growth activities, or may be commodulatory activity; activity, itsue growth activities, or may be commodulatory activities; hemostatic, thrombolytic activities, receptor or liqand activities, or may be commodulatory activities, receptor or liqand activities, or may be conditions or thrombolytic activities; receptor or liqand activities, or may be conditions, e.g., by protein or gene therapy Such conditions include conditions, e.g., by protein or gene therapy Such conditions in activities may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound creating growth. Polypeptides involved with immunomodulatory activities may be used in the treatment of very activities may be used in the treatment of very activities may be used in the treatment of very conditions in addition to immune disease or accidental danger. The present semented repairs of the present semented represents and nucleus and administions, and in the diagno
ameliorating a medical condition in a mammalian subject e.g. arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  screening techniques. The present sequence represents a novel human polypeptide of the invention

New human adaptor protein FRS2 - useful in, e.g. diagnosis, prevention or treatment of abnormal conditions associated with cell proliferation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (especially in mammals). Such abnormal conditions can be associated with cell proliferation or cell differentiation. The protein is also useful to identify compounds that enhance or block FRS2 interactions with natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents an adaptor protein linking protein kinases to activating partners in cells. The protein is designated fibroblast growth factor receptor protein kinase substrate 2 (FRS2). It regulates the growth factor stimulation of cellular differentiation and cellular proliferation by linking stimulated fibroblast growth factor receptor to the Ras/MAPK cascade via Grb-2/SoS complex. The FRS2 protein is useful to diagnose abnormal conditions associated with cell proliferation or cell differentiation in organisms caused by an aberration in a signal transduction pathway characterised by an interaction between a FRS2 polypetide and a neutral binding partner in the receipt of the signal transduction pathway characterised by an interaction between a FRS2 polypeptide and a neutral binding partner in the signal process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   70

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10E176-ABL10E11), expressed DNA sequences (ABL10E176-ABL10E11), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence represents p62-dok (protein downstream of tyrosine kinases) protein. The protein is tyrosine phosphorylated in haematopoieic mammalian cells after stimulation with a ligand for a receptor tyrosine kinase found in oncogenic cells. The p62-dok protein binds p120 ras GTPase-activating protein (GAP). The p62-dok protein is involved in a signal transduction pathway initiated by receptor tyrosine kinase, and is rapidly tyrosine phosphorylated. The p62-dok protein is also present in normal cells, but is not constitutevely phosphorylated by normal receptor tyrosine kinase. Antibodies against p62-dok and aberrantly phosphorylated 62-dok and proceed on the p62-dok and aberrantly phosphorylated decade and treatment of conditions in which an oncogenic tyrosine kinase is active such as chronic myelogenous leukaemia (CML) and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24 GSGIMELTDTELILYTRKRDS-----VKWHYLCLRRYGYDSNLFSFESGRRCQTGQGIF 77

The present invention describes a predictor set comprising a plurality of polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase continuous activity of cells, comprising obtaining a sample of cells, comprising obtaining a sample of cells, contraining whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to correlate the activity of the cells, (2) a plurality of cell innes for correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polynucleotides and collypeptides that predict compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of associated with a disease state, comprising subjecting the plurality of a microarray of polynucleotides that predict the sensitivity or cell lines to one or more compounds, analysing the expression pattern of cells associated with a disease state by using the compounds and polypeptides that predict the sensitivity or cesistance of cells associated with a disease state by using the cyression pattern of the microarray. The polynucleotides and cells associated with a disease state by using the cyression pattern of the microarray. The polynucleotides and polypeptides are useful in predicting the cyresion tyrosine kinase pathways. These may be used in determining drug centeric profiles which aid in treating diseases and disorders (e.g. protein tyrosine kinase pathways. These may be used in determining drug centeric profiles which aid in treating diseases and disorders (e.g. sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              259
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17

The invention relates to an isolated polypeptide that comprises a sequence with 60 % sequence identity to one of 103 prostate specific polypeptide (PSD) sequences (S1), given in specification, or a sequence canced by a nucleic acid comprising one of 114 prostate specific nucleic acid comprising one of 114 prostate specific nucleic acid (PSNA) sequences (S2), given in specification. Also included are a vector comprising the PSNA, a host cell comprising the vector. Also included are a vector comprising the PSNA; an anti-PSP antibody the antibody or its fragment, a kit for detecting a risk of antibody in presence of the PSP or the PSNA in a sample of a patient and a vaccine comprising the PSP or the PSNA in a sample of a patient and a vaccine of a prostate cance of a prostate ca New prostate specific polypeptides useful for identifying, diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate. prostate specific protein; cytostatic; PSP; prostate cancer; gene therapy; vaccine; non-cancerous prostatic disease Sun Y, Liu Human prostate specific protein DEX0283\_179. The present sequence is that of a mouse haematopoietic stem cell (HSC)

specific protein. It is an example of claimed HSC specific proteins (see

ANY1916-93) predicted from novel isolated HSC specific nucleic acids

(see AAZ94077-131). The HSCS are especially primitive HSCS (PHSCS) such

as umbilical cord cells, bone marrow cells and foetal liver cells. The

encoded proteins are growth factors, transcription factors, splicing

factors, capping factors, transport proteins, translation factors or

replication factors that modulate HSC activity, especially

differentiation or replication. The invention provides claimed methods:

cor identifying PHSC-specific nucleic acids, for generating a stem

for identifying pHSC-specific nucleic acids, for generating a stem

coll/progenitor cell from PHSCs; for identifying the presence of a PHSC

in a sample; for identifying the presence in a sample of a compound that

modulates HSC activity; for using such a compound to treat an immune

system condition, especially leukaemia; for introducing exogenous nucleic

acid into a HSC; and for ex vivo expansion of HSCs. Also claimed are

vectors, host cells, and an antibody that specifically binds a an HSC---EPVVERNNHQTELEVPRTPR 124 /note= "nucleotide sequence encoding this protein has an in-frame stop codon following Leu codon 343" LGSGIMELTDTELILYTRKRDSVKWHYLCLRRYGYDSNLFSFESGRRCQTGQGIFAFKCA 82 Hematopoietic stem cell signaling proteins modulating replication and differentiation for treating immune system disorders and leukemia. NOVX sequences can have cytostatic, antidiabetic, neuroprotective, antiparkinsonian and anorectic activities, and can be used in vaccines and gene therapy. The NOVX polypeptides can be used for preparing a composition for treating or preventing a pathology associated with the NOVX-polypeptides e.g. cancer, neurodegenerative disorders such as Parkinson's disease, or metabolic disorders such as diabetes or obesity, or for tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer, neurodegenerative disorders such as Parkinson's disease, or metabolic disorders such as diabetes or obesity, or for tissue typing.

The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, and as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-brager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activin/inhibin activity, chemoctaclic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening,

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, and the encoded polypeptessant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheinear's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activithianian activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                  and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

CC human secreted proteins AABS2012 - AABS2161. Sequences AABS2062 - AABS2103 represent alternative polypeptides encoded by the genes, and amino acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they sproteins have activities dependent on the tissues and cells in which they care expressed. Examples of their activities include cytostatic; musubappressive, nootropic, neuroprotective, antivital, antiallergic, immunosuppressive, nootropic, national antiparastic; and cardiant. The secreted proteins, polypeptides, antagonists and agonists may be atticonvulsant; antibacterial; antiinflammatory, antiuloer; vulnerary; anticonvulsant; antibacterial; antiundary persenting and/or diagnosing diseases and disorders useful in treating, preventing and/or diagnosing diseases and disorders such as cancer, particularly breast and ovariant cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital. Immune disorders such as Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclercais, rheumatoid archergial ischaemias; wound healing; neurological diseases such as myocardial ischaemias; wound healing; neurological diseases such as creebral anoxia and epilepsy; and infections may also be treated using the proteins and polynucleotides of the invention. Sequences AAC95512 - AAC95520 and AABS2011 are used in the isolation and characterisation of the proteins and polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    47 WHYLCLRRYGYDSNLFSFESGRRCQTGQGIFAFKCARAEELFNMLQEIM--QNNSINVVE 104

DOCKING protein 1 (p62(dok)) (Downstream of tyrosine kinase 1) (pp62).
                                                                -!- PTM: Constitutively tyrosine-phosphorylated (By similarity).
-!- PTM: Phosphorylated on tyrosine residues by the insulin receptor kinase. Results in the negative regulation of the insulin signaling pathway (By similarity).
-!- SIMILARITY: BELONGS TO THE DOK FAMILY.
-!- SIMILARITY: Contains 1 PH domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14; Gaps

Cell Biol. 154:345-354(2001).

--- FUNCTION: Docking proteins interact with receptor tyrosine kinases and mediate particular biological responses. May modulate the cellular prolliferation induced by IL-4, as well as IL-2 and IL-3.

--- SUBUNIT: Interacts with RasGAP, TEK/TIE2 receptor and EGF receptor. Interacts with RET.

--- TISSUE SPECIFICITY: Expressed in lung and spleen.

--- PIM: Tyrosine phosphorylated.

--- FIM: Tyrosine phosphorylated.

--- SIMILARITY: Contains 1 PPH domain.

--- SIMILARITY: Contains 1 PPH domain.

-!- FUNCTION: Docking proteins interact with receptor tyrosine kinases and mediate particular biological responses. Functions in RET-mediated neurite outgrowth and plays a positive role in activation of the MAP kinase pathway. Putative link with donwstream effectors of RET in neuronal differentiation (By similarity).
-!- SUBWIT: Interacts with phosphorylated RET. In contrast to other DOK proteins, it does not interact with RASGAP (By similarity).
-!- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isoid=Q9P104-2; Sequence=VSP_003854;
Note=No experimental confirmation available;
DOMAIN: PTB domain mediates receptor interaction (By similarity).
SIMILARITY: BELONGS TO THE DOX FAMILY.
SIMILARITY: Contains 1 PH domain.
SIMILARITY: Contains 1 PTB domain.

TISSUE SPECIFICITY: Specifically expressed in the brain, with a high specificity for neurons.
DEVELOPMENTAL STAGE: In E12.5 and E13 embryos, it is expressed in the central nervous system, e.g., in the neural tube, the dorsal root and the cranial ganglion.

SOMAIN: PIR domain mediates receptor interaction.
SIMILARITY: BELONGS TO THE DOK FAMILY.
SIMILARITY: Contains 1 PH domain.
SIMILARITY: Contains 1 PTB domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Novel p62dok family members, dok-4 and dok-5, are substrates of the c-Ret receptor tyrosine kinase and mediate neuronal

kinase II.";
J. Biol. Chem. 268:18157-18166(1993).
-!- FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- SIMILARITY: Contains 1 PH domain.
-!- SIMILARITY: Contains 1 PTB domain.

Biophys. Acta 1172:323-326(1993).

-!- FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- SIMILARITY: Contains 1 PH domain.

Structural basis for IL-4 receptor phosphopeptide recognition by the IRS-1 PTB domain.";
Nat. Struct. Biol. 3:388-393(1996).

-!- FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- DISEASE: POLYMORRHISMS IN IRSI MAY BE INVOLVED IN THE FILOLOGY OF A SUBSET OF LATE-ONSET NON-INSULIN-DEPENDENT DIABETES MELLITUS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VARIANTS NIDMM TYR-1043 AND TYR-1095.

"Genome sequence of Vibrio parahaemolyticus: a pathogenic mechanism

Lancet 361:743-749(2003).

"ETWCTION: Catalyzes the synthesis of dihydrouridine, a modified

base found in the D-loop of most tRNAs (By similarity).

"COFACTOR: FAD (By similarity).

"SIMILARITY: Belongs to the dus family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacteria; Proteobacteria; Gammaproteobacteria; Vibrionales; Vibrionaceae; Vibrio.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            696

IUS-08-511-438B-4

Sequence 4, Application US/08531439B

Patent No. 5841702

GENERAL INFORMATION:

APPLICANT: Zhang, Hui
APPLICANT: Zhang, Hui
APPLICANT: Zhang, Hui
APPLICANT: CF INVENTION: CYCLIN/CDK Associated Proteins,
TITLE OF INVENTION: CYCLIN/CDK Associated Proteins,
TITLE OF INVENTION: CYCLIN/CDK Associated Thereto
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley, Hoag & Eliot
STREET: One Post Office Square
CITY: Boston
STRTE: MA
COUNTRY: USA
CONPUTER: ISA PC compatible
COMPUTER: ISA PC compatible
COMPUTER: ISA PC compatible
COMPUTER: ISA PC compatible
COMPUTER: ASCII (text)
COMPUTER: ASCII (text)
COMPUTER: ASCII (text)
COMPUTER: SACII (tex
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OSPRATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/787,091
FILING DATE:
CLASSIFICATION TOWNER: US 60/030,418
PILING DATE: 01-NOV-1996
ATTORNEY/AGENT INFORMATION:
NAME: GENERALION NUMBER: 32,227
REGISTRATION NUMBER: 32,227
REFERENCE/POCKET NUMBER: 32,227
REFERENCE/POCKET NUMBER: 32,227
REFERENCE/POCKET NUMBER: 32,227
REFERENCE/POCKET NUMBER: 32,227
REJERPANCE: 617-861-6240
INFORMATION E 617-861-6240
INFORMATION FR SEQ ID NO: 9:
SEQUENCE CRARACTERISTICS:
LENGTH: 38 amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 LESFESGRRCQTGQGIFAFKCARAEELFNMLQ 92
